The greater sage-grouse and many other at-risk species live in and depend on sagebrush shrublands that historically stretched from the Dakotas to California and now occupy about half of their historic extent. Greater sage-grouse populations have declined rangewide by 80% since 1965 and nearly 40% in the last 20 years, and the species appears to be on an extinction trajectory.

In response to petitions to list the greater sage-grouse under the Endangered Species Act, in 2013 the US Fish and Wildlife Service (FWS) and state wildlife agencies jointly identified areas essential for sage-grouse viability called Priority Areas for Conservation. In 2015, BLM finalized its Greater Sage-Grouse Conservation Strategy designating most of the PACs that overlapped BLM lands as Priority Habitat Management Areas (“Priority Habitats”) and committed to managing them to reduce disturbance.

To address continued declines and climate change impacts, BLM is revising its 2015 Greater Sage-Grouse Conservation Strategy. Key to sage-grouse recovery is protecting and restoring a network of intact and crucial habitats – including PACs – across its range and eliminating habitat stressors that compound the effects of climate change and drought.

What is the Condition of the Greater Sage-Grouse Habitat?

- Less than 14% of the Sagebrush Sea remains intact and functioning. In recent years, we have lost an average of 1.3 million acres of habitat per year.\(^1\)
- 47% of BLM-managed Priority Habitats nationwide and 48% in Oregon are in substandard condition.\(^2\)
- About three-quarters of BLM-managed Priority Habitats nationwide and 100% in Oregon are experiencing chronic drought.\(^3\)
- Nationwide, 7% of federal lands within sage-grouse Priority Areas for Conservation are protected.\(^4\)

---

2. This statistic reflects Priority Habitats that overlap grazing allotments that failed to achieve land health standards in the most recent land health evaluation. This is based on BLM land health data collected and analyzed by Public Employees for Environmental Responsibility (2020). See https://peer.org/areas-of-work/public-lands/grazing-reform/mapping-rangeland-health/.
3. County drought data from Farm Service Agency. In this context, a county is in chronic drought if it has a drought meter rating of D3 or more within a year for at least three of the last five years.
4. In this context, protected lands are those in GAP 1 or 2 status in the US Geological Survey Protected Areas Data Base (2022).
How are Sage-Grouse Priority Habitats Faring in Oregon?

The 2015 Greater Sage-Grouse Conservation Strategy established 4,599,358 BLM-managed acres in Oregon as Priority Habitats with protective management direction. Despite this, invasive species, grazing, wildfires, energy development and other activities continue to take a toll.

2,226,348 acres (48%) failing land health standards.
783,485 (17%) acres have never been evaluated.

1,181,638 acres (26%) dominated by invasive weeds and 131,004 (2.8%) acres burnt since 2015.

100% experiencing chronic drought.

Since 2015, 73,543 acres (1.6%) were granted as rights-of-way.
